

Leafy

WRV 2702L - Leafy Silage Hybrid

HYBRID CHARACTERISTICS

Relative Maturity: 99-102 RM	Plant Height for Maturity:	Tall
Seedling Vigor: Excellent	Kernel Texture:	Soft
Ear Flex: Excellent	Ear Type:	White Cob - Girthy Ear

WRV 2702L Based on Whole Plant Percentage:

NDF = Low NFC = High NDFd = Medium

Recommended Planting Population = 26,000 to 28,000

✓ HIGHLIGHTS OF WRV 2702L

- Extreme tonnage for 102 day maturity
- Fantastic grain producer with very soft kernels and white cob
- Excellent NDFd seen in many on farm results
- Exhibits extreme flex cob traits at lower populations
- Very soft cob for non processed corn silage

– CHARACTERISTICS of LEAFY SILAGE SPECIFIC HYBRIDS

1. Leafy hybrids will typically produce 7-10 leaves above the ear resulting in increased yields over non-leafy hybrids
2. Thinner stalk rind, which is traditionally 50-54% digestible
3. Increased pith size in the stalk, which is 72-74% digestible
4. Soft, more floury type kernel textures which increase starch digestibility
5. Increased harvest window due to slower kernel fill. The slow kernel fill allows the stalk and leaves more drying time, which results in more equal overall plant and cob moisture levels
6. WRV Silage specific varieties are selected to provide above average NDFd by nature of highly digestible forage quality
7. Choose a maturity suited for your area. Ideally, plant maturity and harvest should take place prior to a frost to maximize your levels of plant sugars and carbohydrates
8. Most Leafy hybrids will exhibit white cobs with soft texture
